			<i>Building Code Official</i>

ROOFING TERMS YOU SHOULD KNOW

BUTT – The larger, exposed end of a shingle.

DECK – Plywood or oriented-strand board (OSB) sheathing used as a base for securing roofing materials.

DRIP EDGE – An L-shaped metal strip positioned along a roof's edges to allow water to run off roof without running down eaves or siding.

EAVE – On a sloped roof, the horizontal underside that projects out from house wall.

EXPOSURE – The part of a shingle that is exposed to the weather, usually less than half its actual length. **Felt or underlayment**—Asphalt-impregnated roofing paper that creates a secondary, water tight barrier between many roofing products and the roof deck.

FLASHING – Metal pieces that keep water from seeping into intersections such as valleys or joints at vertical walls, or around roof penetrations such as chimneys or vent pipes.

PITCH – Roof slope expressed as the ratio of a roofs rise (vertical distance) to each foot or run (horizontal distance). A "4-in-12 pitch" means the roof rises 4 inches for every 12 inches or horizontal distance.

RAFTERS – The framework that supports the roof deck and roofing. On a sloped roof, these are the angled timbers on the underside.

RAKE – The sloped edge of a roof over a wall.

RIDGE – The peak where two sloped roof sections meet.

SQUARE – A measurement of roof area that equals 100 square feet (an area 10 feet x 10 feet)

VALLEY – Angle formed where two sloping roof surfaces intersect.
